Version Control

Scenario Overview

One of our employees' computer was compromised and we saw this backup file leave the network, but we couldn't find anything other than a simple README.md file in it. Help us find out what information the hackers got. (In this lab a zip file was provided).

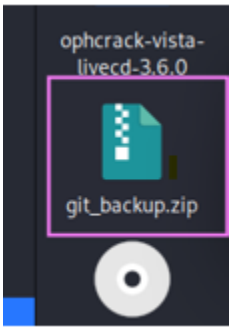
Objective: Determine what information, if any, was extracted or hidden within the backup file.

Tasks

1. Examine the ZIP file for hidden, deleted, or obfuscated content.
2. Identify any metadata, embedded files, or unusual structures within the archive.
3. Determine whether the attackers extracted sensitive information.
4. Document findings and assess the potential impact of the compromise.

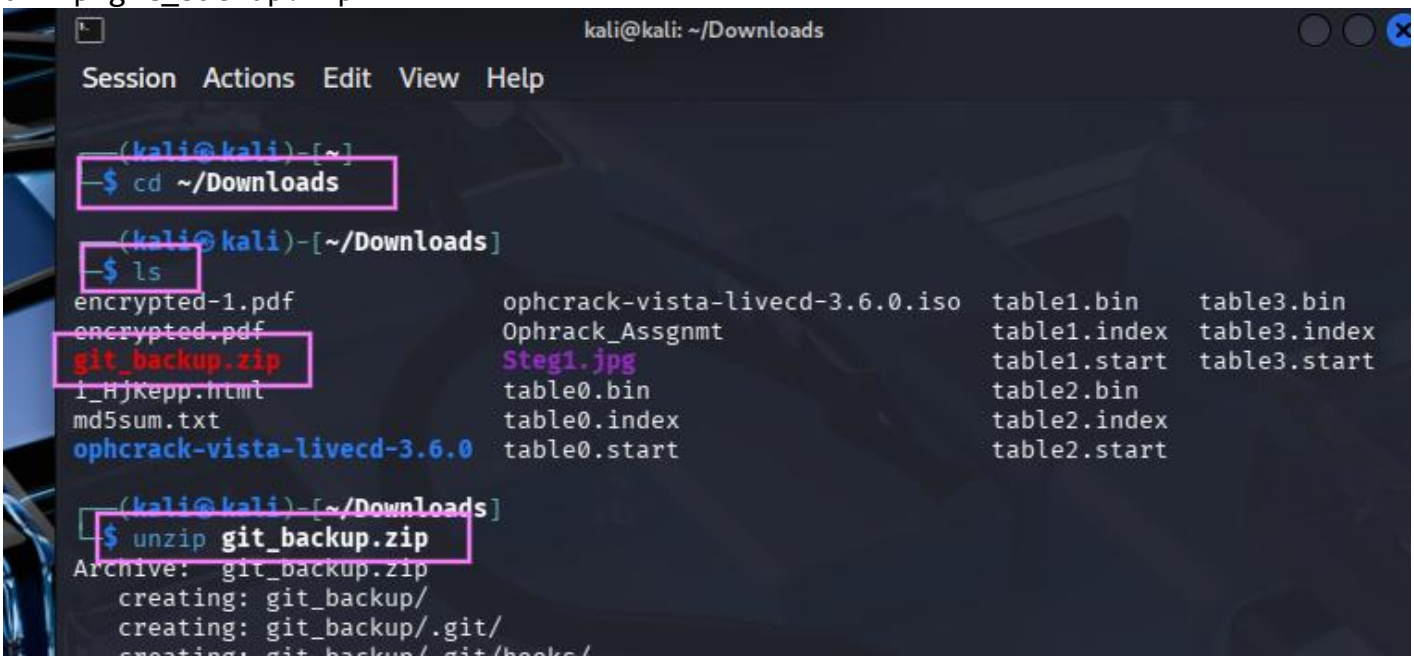
1. What is the email address of the employee who was compromised?

Download the file `git_backup.zip`



Open a terminal and navigate to the Downloads directory:

```
cd ~/Downloads
ls
unzip git_backup.zip
```



To view all files and directories use `~/Downloads/git_backup` followed by `ls -a`
We then see a `.git` repository.

Next, to view and extract information use `git.log` Here we can view any users that are active on this repository.

Answer: gpeterson@mpd.hacknet.cityinthe.cloud

2. Each employee is assigned a flag. What is the flag that was compromised?

To view the commit with the message `Backing up data` we use command `git show` along with the hash `438fa54ba62144ad84376635d957e5e73d89066e` Together will be `git show 438fa54ba62144ad84376635d957e5e73d89066e`

Here we see the flag "**+SKY-LRHX-4910.**"
Answer: +SKY-LRHX-4910

```

3. Greg thinks that he may have had additional account credentials that were compromised. What's the name of the service provider for that other compromised account?

The commit that we are going to access is the `Backup passwords`. This gives an indication credentials may be stored here. Therefore, we are going to access the file using `git show 8557f6a169819fbe8674e8db96d02437fcb6e42a` followed by `ls` We now see a `password.txt` file

```
┌──(kali㉿kali)-[~/Downloads/git_backup]
